

Altrium PerformanceFlow Manual Test Cases

Sprint 1 and Sprint 2 functional and non functional verification

Prepared date: 23 September 2026 Result: 32 Pass | 0 Fail | 5 Not run

Purpose and execution basis

This record follows the supplied test case template: test number, feature, steps, expected outcome, actual outcome and status. It covers the implemented review lifecycle from employee setup through PAR meetings, development planning and cycle closure. The 32 passed outcomes were verified on 23 September 2026 by running the application's isolated regression suite against a temporary database copy. They are route-level and data-level checks, not a claim that each step was repeated by a human in a browser. Five environment-dependent checks remain explicitly marked Not run. The live application database was not changed by this test run.

Test environment and data

Environment: local Flask application and SQLite test copy. Roles: HR, Supervisor, Manager and Employee. Representative records: 2026 review cycle, active employee profiles, performance blueprint items, self and peer reviews, manager approval, PAR meeting, PDP and notifications. Regression command: unittest discovery across test_regressions.py and test_role_audit.py. Execution result: 32 tests ran successfully in about six seconds.

Status meaning: Pass = the expected result was observed in the isolated test run; Fail = observed result differs; Not run = no trustworthy actual result is available. Overall disposition: conditional pass for the verified functional and security scope; browser, accessibility, load and recovery acceptance still requires separate execution.

Functional security and workflow cases

Feature #	Feature name	Steps	Expected outcome	Actual outcome	Status
TC01	Employee profile	As HR, create a Finance employee and choose a supervisor from Operations; then retry with an Operations employee.	Cross-department reporting is rejected; matching department is accepted.	Mismatched assignment was not saved. Matching Operations profile was saved.	Pass
TC02	Review assignment	Create an employee without an active blueprint. Try to assign them to a cycle, then add an active blueprint item and retry.	Only the employee with an active blueprint can be assigned.	Assignment was blocked without an active item and saved after activation.	Pass
TC03	HR records	Search the centralized records as HR, then open the same route as another role.	HR can retrieve records; unauthorized roles cannot.	HR search returned records. Other roles were denied access.	Pass
TC04	Reminders	Trigger reminders twice for the same outstanding action.	One notification is delivered per action, without duplicates.	The outstanding action produced one reminder only.	Pass
TC05	PDP workflow	Record a PAR outcome requiring a PDP; create the plan, update progress, and open monitoring.	Plan, employee progress, and supervisor/HR monitoring remain connected.	PDP creation, progress update, and monitoring states advanced correctly.	Pass
TC06	Cycle activation	Activate a configured cycle containing an assigned employee.	Each workflow stage receives one appropriate action.	One action per stage was created; no duplicate stage actions appeared.	Pass
TC07	Self assessment	Send malformed self-assessment data to the save endpoint.	Invalid request is rejected without a server error.	The endpoint returned HTTP 400 and did not crash.	Pass
TC08	Supervisor input	Submit an invalid supervisor value while editing an employee.	Input is rejected safely; the app remains available.	Invalid supervisor input was handled without a server error.	Pass
TC09	Staff creation	As HR, create a Supervisor account using the profile form.	Supervisor login and profile are created with the selected role.	Supervisor account and matching profile were created.	Pass

Feature #	Feature name	Steps	Expected outcome	Actual outcome	Status
TC10	Cycle closure	Attempt closure before PAR outcome and acknowledgement; complete both and retry.	Closure is blocked until required final records exist.	Premature closure was rejected; eligible closure succeeded.	Pass
TC11	Manager reassignment	As HR, reassign an outstanding approval to another manager.	Pending decision moves to the newly assigned manager.	Approval ownership and action were reassigned correctly.	Pass
TC12	Change requests	As Manager, request changes from two selected participants; inspect each recipient's view.	Only selected people receive their own request and note.	Two targeted requests were created and kept private to their recipients.	Pass
TC13	Employee status	As HR, set an employee inactive and inspect previous reviews.	Employee becomes inactive but historical records remain.	Inactive status saved; review history was retained.	Pass
TC14	Status display	Open the inactive employee workspace after a status update.	Inactive status has warning styling and one success message.	Warning status rendered and only one flash message appeared.	Pass
TC15	Full review flow	Create cycle and blueprint; run self, peer, supervisor and manager stages; acknowledge, hold PAR, create PDP, close.	All handoffs complete in order and records remain available.	The isolated end-to-end workflow reached a closed cycle successfully.	Pass
TC16	Availability	Submit availability values with mixed timezone formats.	Invalid or mixed input is handled without an internal error.	The availability endpoint completed without a crash.	Pass
TC17	Role change	Change an account role while its session remains active; request a protected workspace.	The current role governs access immediately.	The existing session reflected the new role permissions.	Pass
TC18	PAR retention	Close a review, then attempt to cancel its retained PAR meeting.	Closed review meeting record cannot be cancelled.	Cancellation was rejected and the historical meeting remained.	Pass
TC19	PDP after closure	Close the cycle and open the employee's PDP workspace.	Development remains accessible after review closure.	The development workspace remained reachable after closure.	Pass
TC20	PDP privacy	As one employee, request another employee's plan URL.	The other person's plan is not disclosed.	Access to the other employee's plan was denied.	Pass
TC21	PAR scheduling	Try a past meeting time and try marking an unheld meeting complete.	Past scheduling and premature completion are rejected.	Both invalid transitions were blocked.	Pass
TC22	PAR conflict check	Block an attendee's time, then try the conflicting meeting slot; inspect notifications.	Conflicting slot is rejected and working link is private to attendees.	Conflict was rechecked on save; attendee notification used a private link.	Pass
TC23	Navigation	Open role navigation as HR, Supervisor, Manager and Employee.	Allowed destinations open and only one item is active.	All tested role routes were reachable with unique active selection.	Pass
TC24	Password change	Change an account password, then reuse an existing session.	Password changes and old sessions are revoked.	The previous session stopped working after the password change.	Pass
TC25	PDP edit	Edit a plan after employee progress and reminder references exist.	Plan edits retain progress and linked reminders.	Progress records and reminder references remained intact.	Pass
TC26	PDP dates	Submit invalid plan and activity dates.	Invalid dates are rejected without a partial write.	Invalid date input did not update stored plan data.	Pass
TC27	PDP display	Open a plan as HR.	Heading identifies an employee plan, not HR's own plan.	HR view did not display the misleading 'My plan' heading.	Pass

Feature #	Feature name	Steps	Expected outcome	Actual outcome	Status
TC28	Journey status	Advance the cohort through review stages and inspect HR dashboard.	Journey stage reflects actual active-cohort progress.	The displayed stage followed the active cohort state.	Pass
TC29	Account inactivity	Deactivate an account; attempt sign-in and reuse an existing session.	Inactive account cannot sign in or continue a session.	New sign-in and existing session access were blocked.	Pass
TC30	CSRF protection	Submit a protected form without token, then with a valid token.	Missing token is rejected and valid token accepted.	Missing token was rejected; valid-token request succeeded.	Pass
TC31	PDP transaction	Force an action-sync failure while saving a PDP edit.	Plan change rolls back instead of leaving inconsistent data.	The attempted edit was rolled back with no partial update.	Pass
TC32	Database integrity	Open database connections and inspect foreign-key enforcement.	Foreign keys are enabled for application connections.	Application connections enforced SQLite foreign keys.	Pass

Non functional checks awaiting execution

Feature #	Feature name	Steps	Expected outcome	Actual outcome	Status
TC33	Cross-browser UI	Repeat the complete workflow in Chrome, Edge and Firefox at desktop width.	Controls, layouts and validation work consistently in all browsers.	Not run in separate browser environments during this execution.	Not run
TC34	Responsive UI	Open every major screen at phone, tablet and desktop widths; inspect overflow and dialogs.	Text remains readable; no clipping, overlap or inaccessible action.	Not run as a full device-size visual sweep during this execution.	Not run
TC35	Accessibility	Navigate each key workflow by keyboard and inspect labels, focus order and contrast.	All primary actions are keyboard-accessible and clearly labeled.	Not run as a full assisted-technology accessibility audit.	Not run
TC36	Performance	Measure dashboard, cycle, PAR and PDP response times under representative concurrent users.	Response time stays within the agreed service target.	Not run; no agreed production load target or staging load test was available.	Not run
TC37	Recovery	Restore a production-like backup and verify review, PAR and PDP data consistency.	Restored records are complete and access controls remain intact.	Not run; production-like backup/restore was outside this isolated test run.	Not run
